- The aim of the project is to develop HTR software for Hindi Text recognition. HTR is an Text recognition and translation of images of typewritten or handwritten (usually captured by a scanner) into machine-editable text. In this project, the focus is on recognition of Hindi Text in a given scanned text document with the help of Neural Networks And Convert It into normal editable text.

- Handwriting recognition (HWR), also known as handwritten text recognition (HTR), is the ability of a computer to receive and interpret handwritten input from sources such as paper documents, images.
- The process of HTR involves several steps including preprocessing, segmentation, feature extraction, and classification.

- Develop a system which can read and analyze handwritten text and convert it into normal editable text. handwriting recognition involves the automatic conversation of text in an image into text that are usable within computer and text-processing applications.

- A Literature Survey on Handwritten Text Recognition  
Authors: Ayush Purohit Shardul Singh Chauhan Abstract  
and Figures Handwriting recognition has gained a lot of attention in the field of pattern recognition and machine learning due to its application in various fields.
- A Literature Survey on handwritten Text recognition system using neural network is presented in this paper. Neural networks are good at recognizing handwritten text as these networks are insensitive to the missing data. The paper proposes the approach to recognize Hindi text in four stages 1) Scanning, 2) Preprocessing, 3) Feature Extraction and, 4) Recognition.
